

# ForecastXM

## Wind Production Forecasting

**Designed to help wind farm owners & operators, grid operators and energy traders take informed decision based on highly accurate wind forecasting data**

We can forecast any site in the world from a single farm to a whole fleet of farms up to 7 days ahead. By taking historical data and wind turbine characteristics we are able to identify the best meteorological models. Blending different models enables us to achieve the highest resolution, making the most accurate forecasts possible. Once the location is added on to our system our Machine Learning algorithms are able to further improve the forecasts while further improving day.

The information is delivered through our highly customisable dashboard interface. You can easily extract the information into reports and other file formats and customise dashboards into different views as per user requirement. In addition, we can easily integrate with your own internal systems.

Contact us today to find out how ForecastXM can take forecast uncertainty out of your investments.
